

The table below lists the fields we found and the rules we can support from the current project. When our source does not give us an exact rule, we marked it as a team decision instead of guessing.

Screen	Text Input	Max Length	Allowed Characters / Format	Error Message / Behavior
First Admin	Admin Username	32 Min 4	First character must be A-Z or a-z. Remaining characters can be A-Z, a-z, 0-9, or - _ . &. Separators must be between alphanumeric characters; no consecutive or trailing separators.	Empty: The input is empty. Bad first character: A UserName must start with a letter, A-Z or a-z. Too short: A UserName must have at least 4 characters. Too long: A UserName must have no more than 32 characters. Other invalid cases: use our UserNameRecognizer message.
First Admin	Admin Password	255*	Must meet our PasswordEvaluationTestbed requirements. We also need to check if the password is too long.	Use the password recognizer's requirement-specific message. Our team still needs to agree on the exact application maximum.
First Admin	Confirm Admin Password	255*	Same password rules as Admin Password.	If the passwords do not match: The two passwords must be identical.
Login	Username	32 Min 4	Same UserNameRecognizer rules as above.	Use our UserNameRecognizer validation messages.
Login	Password	255*	Must meet our PasswordEvaluationTestbed requirements.	For an unsuccessful login: Incorrect username/password. Try again!
Login / Account Setup	Invitation Code	10*	System-generated invitation code. Our current database allows up to 10 characters.	The invitation code is not valid. / Correct the code and try again.
New Account	Username	32 Min 4	First character A-Z/a-z. Remaining characters can be A-Z/a-z/0-9 or - _ . &. Separators only go between alphanumeric characters.	Use our UserNameRecognizer messages.
New Account	Password	255*	Must meet our PasswordEvaluationTestbed requirements.	Use the password recognizer messages. Our team still needs to agree on the exact application maximum.
New Account	Confirm Password	255*	Same password rules as Password.	If the passwords do not match: The two passwords must be identical.

The username entries use the same validation rules across the application, so we do not need a different username rule for each screen. The 4-32 character range gives us the minimum and maximum checks already supported by the current UserNameRecognizer.

For passwords, the table points back to the PasswordEvaluationTestbed because that is where the password requirements come from. We also need to make sure an oversized password is rejected before it is processed.

The confirmation-password fields are not separate password rules; their main extra check is that they match the password entered in the first field. For the invitation code, we used the current database limit as the starting point.

We used the current database limits as our starting point: 255 characters for the normal text/password fields and 10 for the invitation code.

Overall, the table shows the text inputs in our current Admin, Login, and New Account screens, along with the maximum length, allowed format, and expected error behavior for each one. It gives us a clear starting point for the team's input-validation decisions and for making sure invalid input is stopped before it is used.
