

User Experience

TP1 — Task 3: UX/UI Design Inspiration

Reference application: **Spotify** (accounts.spotify.com / spotify.com/us/account). The screenshots below cover the login flow and the account information update flow (email and password), which the team is using as inspiration for the New User and other non-Admin roles in TP1.

1. Login screen — initial entry

Spotify's initial login screen, offering email/password login as well as Google, Facebook, and Apple SSO options.

The team likes how uncluttered this screen is: one primary field, one primary action, and the alternate sign-in options visually separated below an 'or' divider so they don't compete with the main path. We agreed to keep our own login screen this minimal, with a single clear call to action.

2. Login with password

The screenshot shows the Spotify login interface on a dark background. At the top, there is a navigation bar with a back arrow and the title 'Log in with a password'. Below the title, there are two input fields: 'Email' and 'Password'. The 'Email' field contains the text 'ojaspatil332@gmail.com'. The 'Password' field is empty and has a small eye icon to its right, indicating a show/hide toggle. Below the password field is a large green 'Log in' button. Underneath the button is a link that says 'Log in without password'. At the very bottom of the page, there is a small line of text: 'This site is protected by reCAPTCHA and the Google Privacy Policy and Terms of Service apply.'

The credential entry step after choosing 'Continue' with an email, showing the email and password fields with a show/hide toggle on the password field.

We agreed the show/hide (eye icon) toggle on the password field is a small but valuable usability detail, since it lets users catch typos without weakening security, and we plan to include the same control on our password fields.

3. Login error state

A failed login attempt. Spotify shows a generic 'Oops! Something went wrong' message rather than specifying whether the email or password was incorrect.

The team agreed this is a good security-conscious pattern: a generic error avoids confirming whether a given email exists in the system, which reduces the value of the page to an attacker running credential-guessing attempts. We plan to use similarly generic error text on our own login failures.

4. Authentication success confirmation

A clear confirmation screen shown after successful authentication, telling the user the action is complete and it's safe to close the window.

We liked that the user is never left wondering whether an action went through. The team agreed every state-changing action in our application (login, account updates, password changes) should end with an equally explicit confirmation.

5. Edit personal info (account settings)

The screenshot shows the Spotify web interface for editing personal information. The page has a dark theme. At the top, there's a navigation bar with the Spotify logo, links for 'Premium plans', 'Support', 'Download', and a 'Profile' dropdown. Below the navigation bar is a search bar with the placeholder text 'What can I help with?' and an 'Ask' button. A small note states 'Your search is powered by AI. [Learn](#) how your data is managed and shared.' The main heading is 'Edit personal info'. The form fields are as follows: 'Username' (displayed as 'if4lvsd856562pnbe15g9una'), 'Email' (displayed as 'ojaspati332@gmail.com'), 'Password' (an empty field), 'Gender' (a dropdown menu with 'Male' selected), 'Date of birth' (three fields for month, day, and year, with 'June', '26', and '2006' respectively), and 'Country or region' (a dropdown menu with 'India' selected). At the bottom, there's a link 'Read more about changing your country or region.' and a checkbox labeled 'Share my registration data with Spotify's content providers for marketing purposes.' which is currently unchecked.

The account settings page where a user can view/edit Username, Email, Password, Gender, Date of birth, and Country/region.

The team agreed on the value of grouping all editable account fields on one page with clearly labeled sections, rather than scattering them across multiple screens, and will follow this single-page layout for our New User account page.

6. Change password form

A screenshot of the Spotify web interface showing the password change form. The browser address bar shows 'spotify.com/us/account/login-methods-v2/password/'. The Spotify logo is in the top left, and navigation links for 'Premium plans', 'Support', 'Download', and 'Profile' are in the top right. A search bar with the placeholder 'What can I help with?' is below the navigation. The main heading is 'Password'. Below it are three input fields: 'Current password', 'New password', and 'Repeat new password'. Each field has a small eye icon for toggling visibility. Below the 'New password' field is a checklist titled 'Your password should contain at least' with three items: '1 letter', '1 number or special character (example: # ? ! &)', and '10 characters'. At the bottom left is a link 'Remove password' with a minus icon. At the bottom right are two buttons: 'Cancel' and 'Save new password'.

The dedicated password-change screen, requiring current password plus a new password, with a live checklist of requirements (1 letter, 1 number/special character, 10 characters) and a repeat-password confirmation field.

This is the pattern most directly relevant to TP1. The team agreed this live, itemized requirements checklist maps closely onto our own password recognizer state diagram, and we will adopt a similar real-time checklist so a user can see exactly which requirements are still unmet as they type, rather than only finding out after submitting.

7. Password change success

Confirmation banner shown after a successful password update, with a dismiss (X) control.

The team agreed a dismissible success banner, rather than a modal the user must click through, is a good pattern to reuse. It confirms the change clearly without interrupting the user's flow.

Summary / Team Agreement

The team has reviewed the Spotify login and account-update flow together and agreed that this will serve as our UI inspiration for TP1's New User and other non-Admin roles. Specifically, the team has agreed to carry forward: a minimal single-action login screen; a show/hide toggle on password fields; generic, non-revealing error messages on failed login; explicit confirmation states after every action that changes account data (login, profile edits, password changes); a single consolidated account settings page for all editable fields; and, most directly relevant to our password validation work, a live, itemized password requirements checklist modeled on Spotify's password change form. These patterns will guide the look and feel of our application's non-Admin screens going forward.
